Office Action Summary	Application No.	Applicant(s)	
	10/647,604	HOPPER ET AL.	
	Examiner	Art Unit	
	Johannes P. Mondt	2826	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1) Responsive to communication(s) filed on 27 June 2005.

2a) This action is FINAL. 2b) This action is non-final.

3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4) Claim(s) 1-8 is/are pending in the application.

4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5) Claim(s) _____ is/are allowed.

6) Claim(s) 1-8 is/are rejected.

7) Claim(s) _____ is/are objected to.

8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9) The specification is objected to by the Examiner.

10) The drawing(s) filed on _____ is/are: a) accepted or b) objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a) All b) Some * c) None of:

1. Certified copies of the priority documents have been received.
2. Certified copies of the priority documents have been received in Application No. _____.
3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

1) <input type="checkbox"/> Notice of References Cited (PTO-892)	4) <input type="checkbox"/> Interview Summary (PTO-413)
2) <input type="checkbox"/> Notice of Draftsperson's Patent Drawing Review (PTO-948)	Paper No(s)/Mail Date: _____
3) <input type="checkbox"/> Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08) Paper No(s)/Mail Date: _____	5) <input type="checkbox"/> Notice of Informal Patent Application (PTO-152)
	6) <input type="checkbox"/> Other: _____

DETAILED ACTION

Response to Amendment

Amendment filed 6/27/05 forms the basis for this office action. In said Amendment Applicant substantially amended claims 1-8 through substantial amendment of theb independent claims 1 and 7. Comments on Remarks in said Amendment are included below under "Response to Arguments".

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. **Claims 1-8** are rejected under 35 U.S.C. 103(a) as being unpatentable over Choi et al (US 2001/0001196 A1) in view of Ichikawa (6,611,027 B2).

On claims 1, 5 and 7: Choi et al teach a MOSFET transistor (N.B. : gate insulation layer 102 is thermal oxide; see section [0035]) comprising (cf. Figure 6, cell array region "a"; and Figure 7): an active region 103 of the substrate 100 (section [0030]); perimeter isolation dielectric material 101 formed in the substrate along a perimeter of the active region to define a sidewall interface between the isolation dielectric material 101 and the active region 103 (section [0030]); spaced-apart source and drain regions 150 (section [0032]) to define a substrate channel region therebetween, both the source region and drain region also being spaced apart from the sidewall interface (cf. Figure 6); and a conductive gate electrode 140 including a first

portion that extends over the substrate channel region (short portion of any of the gate array members) and a second portion that extends continuously over the entire said sidewall interface between the isolation dielectric material and the active region (long portion) (cf. Fig. 7), the conductive gate electrode being separated from the substrate channel region by intervening gate dielectric material 152 (cf. section [0030]).

Choi et al do not specifically teach (a) said substrate to have a conductivity type opposite to that of said source and drain regions, nor that (b) said perimeter isolation dielectric material be formed along the entire perimeter of the active region, and (c) that said active region, said perimeter of said active region, and said interface between the isolation dielectric material and the active region are substantially rectangular.

However, it would have been obvious to include limitations (a), (b) and (c) in view of Ichikawa, who, in a patent on how to protect MOS transistors from electrostatic charges (see abstract), - hence pertinent to Choi et al, teach (a) that source/drain regions 21 and substrate 20 to have opposite conductivity type (see col. 7, l. 5-30 and col. 5, l. 20-25, with n-type being the first conductivity type; thus meeting the further limitation of claim 5 as well, while, with regard to claim 5 it is noted that it is well-known in the art that an overall interchange between n-type and p-type conductivities in a device in general does not carry patentable weight unless Applicant explain why said interchange is critical to the invention) and (b) that the perimeter isolation dielectric material 25 (col. 7, l. 19-21) formed in the substrate is extended along the entire perimeter of the active region (loc.cit.) as part of an embodiment that increases electrostatic discharge protection (col. 8, l. 21-32); furthermore, ad (c), that the active

region 20 (Fig. 3) (or 30 in Fig. 4), the perimeter of the active region (outer perimeter of 20 or 30), and the interface between the isolation dielectric material (with field oxide layer 25, see col. 7, l. 20, corresponding to dielectric material 101 in the primary reference of Choi et al) and the active region are substantially rectangular (col. 7, l. 5 – col. 8, l. 38; in particular col. 7, l. 5-22), as shown by Figures 3 and 4.

Motivation to include limitation (a) is merely the enablement of a functioning MOSFET, and motivation to include limitation (b) derives from the obvious enhancement of protection when what needs to be protected is completely surrounded by the protecting material, while motivation for the inclusion of the teaching of limitations ad (c) derives from the maximal simplicity of the rectangular shape of the active region, its perimeter and interface with said dielectric material, given the existence of a primary direction along the gate.

With regard to claim 7, said claim merely recites steps in the process of manufacturing the device as claimed. The device of claim 1 would necessarily have to be formed in order to function. Claim 7 fails to further limit the device of claim 7 other than simply form each of their components.

On claim 2: although the perimeter isolation material in Choi et al is implemented using shallow trench isolation (STI) technology while the use of thermal (i.p.: silicon) oxide is common in said STI technology they do not specifically teach that the perimeter isolation dielectric material comprises silicon dioxide. However, it would have been obvious to include the further limitation of this claim in view of Ichikawa et al, who do teach the use of field oxide (which is necessarily silicon dioxide in view of the silicide

formed underneath metal from which it can be inferred that the most standard selection of silicon is made for the semiconductor material (cf. col. 7, l. 19-21 and 30-36).

On claim 3: the conductive gate electrode by Choi et al comprises polysilicon (cf. Figure 8 and section [0035]).

On claim 4: the gate dielectric material by Choi et al comprises silicon dioxide (see section [0035]).

On claims 6 and 8: Applicant's disclosure does not teach why the range as claimed is critical to the invention. Instead, Applicants merely state their belief that the range should be what is claimed (see page 8 of the Specification). In view of the absence of a teaching why a range is critical to the invention Applicant is reminded that it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or working ranges involves only routine skill in the art. In re Aller, 105 USPQ 233. Finally, with regard to claim 8, said claim merely recites steps in the process of manufacturing the device as claimed. The device of claim 6 would necessarily have to be formed in order to function. Claim 8 fails to further limit the device of claim 6 other than simply form each of their components.

Response to Arguments

3. Applicant's arguments filed 6/27/05 have been fully considered but they are not persuasive. In particular, while the amendment to the Specification removes the grounds for the objection to the Specification made in the previous office action, the active region, its perimeter and interface with the dielectric material in Ichikawa as cited previously are all rectangular while, quite aside from Applicant's own admission of

rectangularity as being in the prior art (cf. Specification, page 1, Figure 1), rectangularity is not only the most widely used but also the simplest form of the active region, its perimeter and interface with the dielectric material that surrounds it that is possible, given the primary direction indicated by a straight gate. Therefore, regrettably, the claims must be rejected over the same art.

Conclusion

4. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Johannes P. Mondt whose telephone number is 571-272-1919. The examiner can normally be reached on 8:00 - 18:00.

Art Unit: 2826

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nathan J. Flynn can be reached on 571-272-1915. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
